1. Project Overview

1.1 Problem Statement

Modern farmers face multiple challenges in determining optimal crop yields and selecting appropriate fertilizer types for their land. These challenges have become more pronounced today due to climate change, soil degradation, unpredictable weather patterns, rising input costs, and the growing need to balance agricultural productivity with environmental sustainability. In addition, there remains a notable gap in the availability and accessibility of modern tools and technologies that can support farmers in optimizing productivity and managing agricultural operations efficiently.

Despite these challenges, several emerging digital agricultural solutions have been developed.

1. One such tool is Ujuzi Kilimo, a Kenya-based AI-driven farming platform that analyzes soil conditions based on chemical properties. It relies on a soil sensor device (SoilPal) that is inserted directly into the ground to measure soil nutrients, pH levels, and overall soil health. The platform then provides fertilizer recommendations and suggests suitable seed varieties based on the analyzed soil data. Farmers can access these services through SMS, USSD, or field agents, making it accessible even in low-connectivity areas.

2. Another example is CropSense, a data-driven decision-support system that integrates satellite imagery, IoT sensor data, weather information, and machine learning models to enhance crop yield, reduce production costs, and improve sustainability. In soil analysis, CropSense focuses on key indicators such as nutrient levels, soil carbon content, and soil moisture to generate recommendations for soil improvement and better land management practices.

1.2 Gap and Invested Stakeholder

Despite these advancements, the existing tools lack a user-friendly interface that can be easily adopted by farmers, particularly those in rural or resource-constrained settings. Additionally, many of the current algorithms rely heavily on chemical soil properties, which require farmers to use specialized and often expensive equipment to obtain accurate measurements.

As a result, there is a notable gap in AI-driven agricultural tools that utilize basic physical soil characteristics, which are easier for farmers to observe and collect without advanced instrumentation or education.

Addressing this gap, the proposed project leverages both physical and photographic soil attributes to design an intelligent algorithm and accompanying mobile application. The system will be hosted on a platform that allows farmers to interact with it in two primary ways:

1. Entering observable physical soil attributes (e.g., texture, color, moisture perception, and structure)
2. Uploading images of their soil for visual analysis

This approach aims to support farmers, particularly emerging farmers, in making informed agricultural decisions by enabling the system to:

- Recommend suitable crops for optimal yield based on physical soil attributes.
- Suggest appropriate fertilizers to improve soil productivity and overall output.

1.3 Models Similar to Our proposed Study

Our model will closely mirror that of PlantVillage Nuru, a mobile application that uses computer vision and deep learning to analyze crop leaves through a smartphone camera and detect diseases, pests, or damage in real time.

Similarly, our project adopts a computer vision–based approach, but extends the concept from crop health diagnosis to soil analysis, enabling farmers to obtain actionable insights using only a smartphone.

The project will also benefit:

- Ministry of agriculture for fertilizer imports and location deployment.
- Agricultural Food Authority for yield predictions based on location.

2.0 Business Understanding

2.1 Business Problem

Existing AI-driven farming tools predominantly rely on chemical soil attributes to provide recommendations regarding suitable crops and fertilizer options. However, relatively few models leverage physical soil characteristics, despite their accessibility and ease of observation for many farmers.

Additionally, there is a limited number of agricultural AI tools that offer intuitive and user-friendly interfaces tailored to the needs of farmers, particularly those with minimal technical expertise. Furthermore, to the best of our knowledge, very few existing systems allow farmers to upload images of their soil for automated analysis and insight generation.

To address these challenges, this project focuses on predicting soil types using a combination of image-based and observable physical attributes. Specifically, the model will utilize:

- Photographic images of soil samples.
- Physical soil characteristics including: erosion type, surface crust, surface salt presence, surface stones, landform, slope class, slope position, bare soil conditions and grazing signs.

This multimodal approach is intended to enhance accuracy and enable farmers to obtain reliable crop suggestions and agricultural recommendations using readily available information.

2.2 Business Questions

The project seeks to answer the following business questions:

Primary Question:

How effectively can crop type be predicted by combining soil images with field-observed physical soil attributes?

- How accurately can crop type be predicted using field-observed physical soil indicators (erosion signs, slope characteristics, surface stones, and crust formation)?
- How accurately can crop type be predicted using soil images?

Secondary Questions:

1. Which physical soil attributes (slope class, landform, erosion type, grazing signs) are the strongest predictors of crop type?
2. Which land management practices (irrigation mode, manure application, ploughing direction, tillage mode, ploughing sign) have the greatest influence on crop type selection?
3. How do grazing intensity indicators (overgrazing signs, bare soil exposure, dung presence) affect the suitability and prediction of crop types?
4. How does geographical location (latitude, longitude and altitude) influence the crop type grown?

2.3 Business Objectives

The main objective of this project is to develop a dashboard and mobile application that enables farmers to both upload images of their soil and input observable physical attributes in order to obtain reliable crop suggestions and data-driven agricultural recommendations using readily available field information.

3.0 Data Understanding

3.1 Data Description and Sources

This project will utilize 2 datasets that contain information on:

1. The physical soil attributes together with georgaphic, land management practices and grazing intensity indicators.
2. Several images of different types of soil.

- Both datasets will be sourced from Soil4Africa website: https://africasis.isric.org/.
- The dataset on the 1st variables is located at: https://africasis.isric.org/ows/s4a_data?SERVICE=WFS&REQUEST=GetFeature&VERSION=2.0.0&TYPENAMES=ms:plot_field_data_down
- The dataset on the images is located at: https://dashboards.isric.org/explore/?form_data_key=fNmSEonazan2E4MnCgHz5GzczrnLcKcQlL9TIypbsSFULw28VG6WViVNTR8xOhLr

Our goal is to merge both datasets using a common 'PLOT CODE' that is shared between them.

3.2 Target Variable

- Our target variable will be 'crop type' which is a multi-class problem with over 11 different crops.

3.3 Feature Variables

- Our feature variables will include the remaining geographic, physical soil attributes, land management practices and grazing intensity indicators. These add up to a total of 54 features:

Identifiers and geographical attributes

- X — Longitude (X coordinate)
- Y — Latitude (Y coordinate)
- plot_code — Plot Code
- country_code — Country Code
- survey_date — Survey Date
- altitude — Altitude
- longitude — Longitude
- latitude — Latitude
- tsu_id — Technical Sampling Unit Identifier
- plot_id — Plot Identifier
- country_name — Country Name

Physical soil attributes

- obstruct_lyr — Obstructive Layer Presence
- depth_restriction_cause — Depth Restriction Cause
- sign_of_erosion — Signs of Erosion
- rill_erosion — Rill Erosion Presence
- gully_erosion — Gully Erosion Presence
- mass_erosion — Mass Erosion Presence
- stone_pedestals — Stone Pedestals Presence
- stone_pavement — Stone Pavement Presence
- wind_erosion — Wind Erosion Presence
- srf_salt — Surface Salinity
- srf_crust — Surface Crusting
- crsfrgab — Coarse Fragments Abundance
- srf_stone — Surface Stone Cover
- lndform — Landform Type
- slope_class — Slope Class
- slope_position — Slope Position
- slope_pathway — Slope Pathway

- tree_rating_15m_above — Tree Cover Rating (Above 15m)
- tree_rating_3m_15m — Tree Cover Rating (3m–15m)
- shrub_rating — Shrub Cover Rating
- herbaceous_rating — Herbaceous Cover Rating
- bare_soil — Bare Soil Percentage
- main_land_use — Main Land Use
- life_forms — Dominant Life Forms
- field_size — Field Size
- field_distribution_pattern — Field Distribution Pattern

Land management practices

- ploughing_sign — Evidence of Ploughing
- ploughing_direction — Ploughing Direction
- tillage_mode — Tillage Mode
- input_crop_residue — Crop Residue Input
- input_green_manure — Green Manure Input
- input_animal_manure — Animal Manure Input
- input_inorganic — Inorganic Input (Fertilizer Use)
- water_supply — Water Supply Availability
- irrigation_mode — Irrigation Mode
- irrigation_water_source — Irrigation Water Source

Grazing intensity indicators

- grazing_sign_present — Presence of Grazing Signs
- grazing_sign_infrastructure — Grazing Infrastructure Presence
- grazing_sign_droppings — Presence of Animal Droppings
- grazing_sign_grass — Grazing Impact on Grass
- overgrazing_sign_bare — Overgrazing Indicator (Bare Soil)
- overgrazing_sign_dung — Overgrazing Indicator (Dung Concentration)
- overgrazing_sign_deforest — Overgrazing Indicator (Deforestation Signs)

4.0 Data Preparation and Cleaning

4.1 Data Preparation

In [1]:
```
# We will start by importing the necessary libraries for data cleaning and visualiza
# Data cleaning libraries
import pandas as pd
import numpy as np

# Data visualization libraries
import matplotlib.pyplot as plt
%matplotlib inline
import seaborn as sns
from IPython.display import display

# Image viewing libraries
```

```
import base64
from PIL import Image
from io import BytesIO

# Libraries for data model preparation
from sklearn.model_selection import train_test_split
from sklearn.preprocessing import StandardScaler
from sklearn.pipeline import Pipeline

# Libraries for machine learning
from sklearn.ensemble import RandomForestClassifier
from sklearn.tree import DecisionTreeClassifier
from sklearn.linear_model import LogisticRegression

# Libraries for neural network
import tensorflow as tf
from tensorflow import keras
from tensorflow.keras import layers, models, callbacks
from sklearn.utils.class_weight import compute_class_weight

# Libraries for model evaluation
from sklearn.metrics import accuracy_score, classification_report

# Libraries for hyper-parameter tuning
from sklearn.model_selection import RandomizedSearchCV, GridSearchCV

# Deployment libraries
import joblib
import os
```

Loading the Physical Soil Attributes Dataset

In [2]:

```
# Loading the physical soil attributes dataset and checking if our data has loaded c

soil_df = pd.read_csv('datasets/physical_soil_attributes.csv')
soil_df.head()
```

Out[2]:

	X	Y	plot_code	country_code	survey_date	altitude	longitude	latitude	
0	6.094781	7.423652	NG018-7-1	NG	2022/10/10	387	6.094781	7.423652	77096070

dtypes: float64(9), int64(3), object(43)
memory usage: 5.8+ MB
```

There is a total of 13876 entries and 55 columns. Below is a summary of the data:

- Fully complete columns (no missing values):

1. Float64: X, Y, longitude, latitude
2. Int64: altitude, tsu_id, plot_id 3.Object: plot_code, survey_date, country_name

- Columns with few missing values:

1. country_code (~141 missing) – object
2. sign_of_erosion (~149 missing) – object

- Moderately missing (~60% missing):

1. obstruct_lyr – float64
2. depth_restriction_cause – object

- Highly missing (~80% missing):

1. rill_erosion – object
2. gully_erosion – object
3. mass_erosion – object
4. stone_pedestals – object
5. stone_pavement – object
6. wind_erosion – object

- Mostly complete but some missing:

1. overgrazing_sign_dung – object
2. overgrazing_sign_deforest – object

Missing values

In [4]:
```
# Checking the number of missing values in each column using a for loop with results
missing_values = soil_df.isnull().sum()
missing_values = missing_values.sort_values(ascending=False)

```

Loading the Soil Photos Data

We developed a scraping function that:

- **Set configuration and paths**
  Defines a download directory, ensures it exists, and sets the total number of pages to scrape (21).
- **Initialize Selenium WebDriver**
  Configures Chrome options (auto-download without prompts), launches the browser, and prepares waiting and interaction utilities.
- **Open target dashboard**
  Navigates to the ISRIC Superset dashboard URL and scrolls to the bottom to trigger full table loading.
- **Wait for initial data load**
  Pauses execution to allow dynamic content (especially the bottom table) to render.
- **Apply "Kenya" filter**
  Expands the *Country name* filter panel, types "Kenya," selects it from the dropdown, and applies the filter.
- **Wait for filtered data reload**
  Allows time for the dashboard to refresh and display only Kenya-related data.
- **Adjust table to show 20 entries per page**
  Locates the table length dropdown and changes it to display 20 rows, then waits for reload.
- **Iterate through all pages (main scraping loop)**
  For each page (1 → 21), performs the following:
  - Opens the bottom table's menu (three-dot menu).
  - Hovers over the "Download" option.
  - Clicks "Export to CSV" to download data as a ZIP file.
- **Handle file downloads and renaming**
  Waits for downloads to finish, then renames each ZIP file sequentially (e.g., `K1.zip`, `K2.zip`, ...).

- **Paginate to the next page**
  Scrolls to the pagination controls, clicks the next page number, verifies the page activated (via UI highlight), and waits for new data to load.

- **Error handling and cleanup**
  Catches critical errors, saves a screenshot if pagination fails, and ensures the browser is closed at the end.

The python file containing the scraping function is in the data folder. We were able to successfully scrape 21 folders, each with 20 images of Kenyan Soil.

- These were uploaded to a Google Drive: https://drive.google.com/drive/u/0/folders/1honHwyjgb__J80g5asjNfgTUTje_N--E

- Prior to concatenating our 21 datasets, we used 1 dataset as a trial to view our images.

In [12]:
```
# Trial with K1 dataset (this dataset contains the first 20 images of the first page
trial_photo_ds_1 = pd.read_csv("datasets/K1.csv")
trial_photo_ds_1.head()
```

Out[12]:

	plot_code	country_name	horizontal_down_photo	
0	KE061-1-1	Kenya	<a href="...	href="data:image/png;base
1	KE061-2-3	Kenya	<a href="...	href="data:image/png;base

Out[20]:

	plot_code	country_name	horizontal_down_photo	
0	KE061-1-1	Kenya	<a href="...	href="data:image/png;base
1	KE061-2-3	Kenya	<a href="...	href="data:image/png;base6

- The images are encoded in a string that is a data URL (Data URI) containing an image encoded in Base64.

Working with the above format is associated with the following:

- Large file size overhead → Base64 encoding increases size by ~33%, making storage and transfer less efficient compared to normal image files
- Memory usage → Entire image must be loaded into memory as a string before decoding, which can be heavy for large datasets or many images
- Slower processing → Requires encoding/decoding steps, adding CPU overhead when reading or writing images
- Harder to manage → Images are embedded in text, so you can't easily preview, edit, or organize them like normal .png/.jpg files.

Secondly, we noted by viewing the images that the vertical photos all have noise data including:

- Hand tools used by the farmers.
- Holes dug by the farmers.

These may lead to:

- Spurious feature learning (shortcut bias) - The network may latch onto tools or hole shapes instead of soil properties. This is a classic case of models exploiting Spurious Correlation, where non-causal cues become predictive simply because they co-occur with labels.
- Reduced generalization. If test images don't contain tools/holes (or contain different ones), performance drops. The model will not have learned soil characteristics; it would have instead learnt context artifacts.

We noted however that the horizontal_up photos have minimal noise and still capture both crop and soil characteristics. We will therefore:

1. Drop the horizontal_down (since it is a repetition of the horizontal_up and naturally, photos are taken in a horizontal up manner) as well as vertical photos (due to noise effect).
2. Convert the maintained 'horizontal_up' photos to arrays that will make it easy to analyze the dataset and machine learning.
3. Store the file as a new csv file - 'soil_photos'

In [21]:
```

From the output above on summary statistics:

- All our columns are of the 'object' data type.
- There are no missing entries

Combined dataset having both physical soil attributes and soil images

To have an algorithm that incorporates both physical soil attributes and soil images, we will incorporate our cleaned soil_df (which contains the dataframe with the cleaned physical soil attributes) and the combined soil_df (which contains the Cleaned Kenyan Dataset with images as numpy arrays).

- We expect an eventual dataset that contains only Kenyan Data.
- This will be used solely for soil image classification.

In [34]:
```
# We will merge the datasets using pandas.merge

merged_physical_and_images_df = pd.merge(combined_soil_photos_df, cleaned_soil_df, o

# Confirming the merger by confirming the length of the dataset. We expect 396 entri

len(merged_physical_and_images_df)
```

5 rows × 38 columns

- The limitation of the 87 samples in the combined Kenyan dataset (covering both physical attributes and soil data) is due to the small sample size in cleaned_soil_df.
- Therefore, this combined dataset will only be used to train the soil image classifier for the dashboard, making it more specific to the Kenyan context.
- However, the broader physical_soil_attributes dataset from soil_df will be used to train a separate model for general crop type prediction across Africa.

merged_physical_and_images_df.to_csv("datasets/merged_physical_and_images_df.csv", i
```

5.0 Exploratory Data Analysis

In this section we will analyse the following:

1. Which physical soil attributes (slope class, landform, erosion type, grazing signs) are the strongest predictors of crop type?

2. Which land management practices (irrigation mode, manure application, ploughing direction, tillage mode, ploughing sign) have the greatest influence on crop type selection?

3. How do grazing intensity indicators (overgrazing signs, bare soil exposure, dung presence) affect the suitability and prediction of crop types?

4. How does geographical location (latitude, longitude and altitude) influence the crop type grown?

5.1 General Analysis

In [38]:
```
# We will start by dropping the plot_code, latitude, longitude, country_name, countr

cleaned_soil_df_columns_to_remove = ['plot_code', 'latitude', 'longitude', 'country_

# We will create a variable called cleaned_soil_df_analysis that will contain the cl
cleaned_soil_df_analysis = cleaned_soil_df.drop(columns=cleaned_soil_df_columns_to_r
```

In [39]:
```
# We will create a variable containing the column of cleaned_soil_df_analysis to run
cleaned_soil_df_analysis_columns = cleaned_soil_df_analysis.columns

# We will use a for loop to give a generate value_counts of the remaining columns an

for column in cleaned_soil_df_analysis_columns:
    value_counts = cleaned_soil_df_analysis[column].value_counts()
    plt.figure(figsize=(10, 5))
    sns.barplot(x=value_counts.index, y=value_counts.values)
    plt.title(f'{column.capitalize()}')
    plt.xlabel(column)
    plt.ylabel('Count')
    plt.xticks(rotation=45)
    plt.show()

Summary Findings.

Physical Soil Attributes

- In most instances there was no erosion (1800 vs 600).
- Most land did not contain any surface salt (2400 vs 50).
- There was no surface crust (2400 vs 100).
- Most land had either very few or few coarse fragments abundance [crsrfgab] (1159, 750).
- Most land had fine gravel and medium gravel (1150, 750).
- Most land was level land or sloping land (1550, 800). A small majority was steep land (100).
- Most land was either very gently sloping, flat, or gently sloping (790, 690, 500).
- Most land had no bare soil (1800 vs 600).

Land Management Practices

- Most land was cultivated and managed land (2300). Very few were cultivated aquatic or semi-natural vegetation (200 vs 150).
- The most common life forms were herbaceous-graminoids and herbaceous-non-graminoids (1400 vs 500).
- The most common crop type was cereals (1500), roots and tubers (250), pulses (200), oil crops (180), and fruits (170).
- Most land was either 2 to 5 acres (900) or 1 to 2 acres (600).
- The common field distribution pattern was contiguous vs non-contiguous (1150 vs 1100).
- In terms of ploughing, most land had signs of tillage in the past while some had signs of fields recently tilled (1200 vs 980).
- Most farmers ploughed along contours (1050).
- Most lands were tilled manually using a hoe (1050) while some were tilled using animals (800). Only (400) were tilled using a mechanical tractor.
- Almost an equal amount of farmers used crop residue as fertilizer (1300 vs 1100).
- Most farmers relied on rainfall (2300) as compared to irrigation (200).

Grazing Intensity Indicators

- Most land did not show signs of grazing (1600 vs 800).
- Neither did they have any grazing infrastructure (2100 vs 450).
- They also did not have grazing sign droppings (1750 vs 750).
- And did not have any grazing grass (1750 vs 750).
- Most land did not show signs of overgrazing deforestation (2100 vs 400).

5.2 - 5.5 Determining the strongest attribute predictors of crop type

In order to do this, we will:

1. Index the columns of specific attribute predictors (Geometric, Physical, Land Mangement Practices and Grazing Intensity Indicators)

- We will be using the soil_df in which we dropped columns that had null entries: 'obstruct_lyr', 'depth_restriction_cause', 'rill_erosion', 'gully_erosion', 'mass_erosion', 'stone_pedestals', 'stone_pavement', 'wind_erosion', 'slope_position', 'slope_pathway', 'tree_rating_15m_above', 'tree_rating_3m_15m', 'shrub_rating', 'herbaceous_rating'.

1. We will name the variables of the above by the abbreviations of the classes of the attribute predictors.
2. We will group the expected four variables and name them as attribute predictors.
3. We will then use a for loop to loop over the individual predictors and apply Lasso style regularisation for classification so that less useful variables' coefficients are reduced to exactly zero.
4. This way, we will have carried out feature selection and will have identified the most important features per attribute class.

```

Most important Geographical features

- Country location plays a strong role in predicting crop type.
- The most influential countries are:
  - **Ghana** (0.524)
  - **Tunisia** (0.491)
  - **Benin** (0.436)
  - **Morocco** (0.410)
  - **Angola** (0.397)

Most important Physical Soil features

- Vegetation and land cover characteristics are the strongest predictors within soil attributes.
- Key features include:
  - **Herbaceous (Non-Graminoids)** (0.792)
  - **Tree-based systems** (0.725)
  - **Vines** (0.709)
  - **Shrubs** (0.655)
  - **Cultivated aquatic or regularly flooded areas** (0.499)

Most important Management features

- Farming practices significantly influence crop type selection.
- The most important practices are:
  - **Manual tillage (hoe)** (0.679)
  - **Rainfed water supply** (0.522)
  - **Mechanical tillage (tractor)** (0.451)
  - **Signs of recently tilled fields (ridges/heaps)** (0.357)
  - **Use of animal manure** (0.335)

Most important Grazing Sign features

- Grazing activity indicators also contribute to crop type prediction.
- Key indicators include:

- **Grass grazing present** (0.542)
- **Grazing infrastructure present** (0.535)
- **General grazing presence** (0.356)
- **Animal droppings present** (0.319)
- **Dung-related overgrazing signs** (0.154)

5.6 Determining the relation between physical attributes and crops grown.

In [43]:
```
# Using a for loop to index into the different physical soil columns

for column in soil_cols:
    print(f"\n Percentage Breakdown: Crop Type vs {column}")

    # Normalize='index' gives the proportion (0.0 to 1.0) for each crop row
    # Multiply by 100 to convert it into a readable percentage (0% to 100%)
    ctab_pct = pd.crosstab(soil_df['crop_type'], soil_df[column], normalize='index')

    # Round to 2 decimal places so the tables are neat and easy to read
    ctab_pct = ctab_pct.round(2)

    display(ctab_pct)
```

```
Percentage Breakdown: Crop Type vs sign_of_erosion

Summary of which physical conditions favored particular crop types.

1. Cereals

- Soil Composition: Thrives in fine gravel (49%) with very few coarse fragments (47%).
- Topography: Found predominantly on level land (64%) that is either flat (31%) or very gently sloping (32%).
- Vegetation & Layout: Strongly associated with herbaceous graminoids (73%). Typically grown in 2 to 5 acre fields (37%) using contiguous patterns (both regular and irregular).

1. Fibre Crops

- Soil Composition: Prefers fine gravel (40%) and medium gravel (39%) with very few coarse fragments.
- Topography: Overwhelmingly grown on level land (77%) that is very gently sloping (41%).
- Vegetation & Layout: Associated largely with trees (31%) and herbaceous plants. Grown in 2 to 5 acre fields (36%) with highly regular, contiguous patterns (63%).

1. Fodder Plants

- Soil Composition: Best suited for fine gravel (41%) with very few coarse fragments (53%).
- Topography: Dominates on level land (82%) with flat terrain (53%).
- Vegetation & Layout: Notably, this crop has the highest association with cultivated aquatic/flooded areas (38%). Associated with herbaceous graminoids (65%) and grown in slightly larger fields ranging from 2 to 12 acres.

1. Fruits

- Soil Composition: Grown in fine gravel (39%) or medium gravel (35%) with very few coarse fragments.
- Topography: Prefers level land (74%) with flat terrain (39%).
- Vegetation & Layout: Heavily associated with trees (54%). Typically grown in 2 to 5 acre fields (33%) following regular, contiguous patterns (56%).

1. Nursery Stock

- Soil Composition: Uniquely prefers coarse gravel (50%) with very few coarse fragments.
- Topography: Uniquely prefers sloping land (75%) across a mix of flat, moderately steep, sloping, and strongly sloping classes.
- Vegetation & Layout: Grown in very small fields of less than 1 acre (75%) with scattered field distribution patterns (50%). Half of these fields feature bare soil.

1. Oilcrops

- Soil Composition: Prefers fine gravel (42%) and medium gravel (40%).
- Topography: Found on level land (64%) that is very gently sloping (40%).
- Vegetation & Layout: Mostly associated with herbaceous non-graminoids (44%) and trees (34%). Typically found in 2 to 5 acre fields (34%) with regular, contiguous patterns.

1. Other Crops (e.g., rubber)

- Soil Composition: Grown in fine gravel (52%) with very few coarse fragments (57%).
- Topography: Prefers level land (64%) with flat terrain (34%).

- Vegetation & Layout: Associated with trees (36%) and graminoids (32%). Predominantly grown in 2 to 5 acre fields (50%) with irregular contiguous patterns.

1. Pulses

- Soil Composition: Prefers fine gravel (39%) and medium gravel (35%).
- Topography: Grown on level land (61%) that is very gently sloping (38%).
- Vegetation & Layout: Strongly associated with herbaceous non-graminoids (53%). Typically found in 2 to 5 acre fields (35%) with regular contiguous patterns.

1. Roots and Tubers

- Soil Composition: Found in fine gravel (50%) with varying levels of coarse fragments (Common to Very Few).
- Topography: Shows a higher tolerance for slopes; while 53% is on level land, 39% is on sloping land. Terrain is mostly very gently sloping (27%) or gently sloping (24%).
- Vegetation & Layout: Associated with herbaceous non-graminoids (51%). Grown in 2 to 5 acre fields, but uniquely features highly irregular contiguous field patterns (57%).

1. Semi-Luxury Foods (coffee, tea, cocoa, tobacco, nuts)

- Soil Composition: Prefers medium gravel (33%) and fine gravel (30%).
- Topography: Found across a mix of level land (50%) and sloping land (41%).
- Vegetation & Layout: Associated with trees (34%) and shrubs (28%). Typically grown in slightly smaller fields of 1 to 2 acres (30%) with regular contiguous patterns.

1. Vegetables

- Soil Composition: Grown in fine gravel (35%) or medium gravel (31%) with very few coarse fragments.
- Topography: Strongly prefers level land (85%) with flat terrain (46%).
- Vegetation & Layout: Associated with herbaceous non-graminoids (50%). Field sizes are highly diverse (evenly split between <1 acre, 2-5 acres, and 5-12 acres), typically utilizing regular contiguous patterns.

Despite the recommendations and given that soil has more than 1 physical attribute, we also recommend the use of the developed models to better predict crop type.

5.7 Determining which fertilizer supported certain crops types

Prior to Modelling, we will also look at the fertilizers which each crop is associated by.

In [44]:
```
# First we will create a variable called fertilizers that only has the 4 categories
management_column = soil_df[management_cols]
fertilizers = management_column[["input_crop_residue", "input_green_manure", "input_
```

```
# Checking the fertilizers
fertilizers.head()
```

Out[44]:

	input_crop_residue	input_green_manure	input_animal_manure	input_inorganic
19	Yes	Yes	Yes	No
21	Yes	Yes	Yes	Yes
22	Yes	Yes	Yes	No
23	Yes	Yes	Yes	No
24	Yes	Yes	Yes	No

In [45]:

```
# Now we will use a for loop to see the relation between crop type and fertilizers
# Loop through each fertilizer column

for column in fertilizers.columns:
    print(f"\nPercentage Breakdown: Crop Type vs {column.capitalize()}")

    ctab_pct = pd.crosstab(
        soil_df['crop_type'],
        fertilizers[column],
        normalize='index'
    ) * 100

    ctab_pct = ctab_pct.round(2)

    display(ctab_pct)
```

```
Percentage Breakdown: Crop Type vs Input_crop_residue
```

input_crop_residue	No	Yes

input_inorganic	No	Yes
crop_type		
Vegetables	53.85	46.15

Which fertilizer supports particular crop types.

1. Cereals

- Crop residue: 47.22% Yes, 52.78% No
- Green manure: 10.35% Yes (very low adoption)
- Animal manure: 28.55% Yes
- Inorganic fertilizer: 40.93% Yes

1. Fibre crops

- Crop residue: 48.57% Yes (balanced usage)
- Green manure: 12.86% Yes (low)
- Animal manure: 15.71% Yes
- Inorganic fertilizer: 50.00% Yes (highest among inputs)

1. Fodder plants

- Crop residue: 35.29% Yes
- Green manure: 8.82% Yes (very low)
- Animal manure: 23.53% Yes
- Inorganic fertilizer: 35.29% Yes

1. Fruits

- Crop residue: 38.46% Yes
- Green manure: 20.19% Yes (relatively higher than most crops)
- Animal manure: 34.62% Yes
- Inorganic fertilizer: 29.81% Yes

1. Nursery stock

- No fertilizer usage recorded across all types (100% No)

1. Oilcrops

- Crop residue: 54.62% Yes (most used input)
- Green manure: 8.40% Yes
- Animal manure: 10.92% Yes
- Inorganic fertilizer: 33.61% Yes

1. Other crops (e.g., rubber)

- Crop residue: 15.91% Yes
- Green manure: 2.27% Yes (extremely low)
- Animal manure: 6.82% Yes
- Inorganic fertilizer: 18.18% Yes

1. Pulses

- Crop residue: 42.29% Yes
- Green manure: 8.57% Yes
- Animal manure: 26.86% Yes
- Inorganic fertilizer: 29.71% Yes

1. Roots and tubers

- Crop residue: 51.13% Yes (slightly dominant)
- Green manure: 12.78% Yes
- Animal manure: 24.06% Yes
- Inorganic fertilizer: 21.05% Yes

1. Semi-luxury crops (coffee, tea, cocoa, tobacco, nuts)

- Crop residue: 41.84% Yes
- Green manure: 7.14% Yes
- Animal manure: 21.43% Yes
- Inorganic fertilizer: 45.92% Yes (most used input)

1. Vegetables

- Crop residue: 46.15% Yes
- Green manure: 7.69% Yes
- Animal manure: 46.15% Yes (high usage)
- Inorganic fertilizer: 46.15% Yes (equally high usage)

6.0 Modelling

In this section, we shall develop two models to predict crop type based on:

1. Physical soil attributes.
2. Soil Images

- We shall only use the physical soil attributes as our features in the first model and soil images as our feature in the second model. In both, crop type will be our target.
- The models will include Decision Trees, Random Forest classifier and Neural Networks.
- For each of the models above, we will first develop a model with base hyper parameters, then develop a model with tuned hyper parameters.
- We will then test each model on the training and testing data sets to determine over or under fitting.

Why select the 2 models?

Benefits of Decision Tree

- Decision trees can directly predict multiple classes without needing to transform the problem.
- Decision trees can model complex, non-linear relationships between features and classes.
- Trees can focus on splitting to maximize information gain for each class, making them robust.
- One can tune several hyper parameters such as tree depth, min samples per leaf, etc., to control complexity and reduce overfitting in multiclass problems.

Benefits of Random Forest Classifier

- By averaging the multiple trees, Random Forest Classifier reduces errors and overfitting from individual models.
- It also handles large and omplex data better.
- It is robust to noise and outliers.
- Captures broader patterns that apply better to unseen data.

6.1 Model on physical soil attributes vs. crop type

In [47]:
```
# Defining our X (features) and y (target)
X = phyc_soil_df
y = soil_df["crop_type"]

# One Hot Encoding X features and y target
X = pd.get_dummies(X, drop_first=True)
y = pd.get_dummies(y, drop_first=True)

# Force numeric types
X = X.apply(pd.to_numeric, errors="coerce")

# Splitting into training and test set
X_train, X_test, y_train, y_test = train_test_split(
    X, y,
    test_size=0.2,
    random_state=42,
    stratify=y
)
```

In [48]:
```
# Developing pipelines for base Decision Trees (dt) and base Random Forest Classifie
pipelines = {
    "dt": Pipeline([
        ("model", DecisionTreeClassifier(
            random_state=42
        ))
    ]),

    "rf": Pipeline([
        ("model", RandomForestClassifier(
            random_state=42
        ))
    ])
}
```

In [49]:
```
# Printing our accuracy scores for both base random forest and base xg boost
base_results = {}

for name, pipe in pipelines.items():

    # Fit model
    pipe.fit(X_train, y_train)

    # Predictions
    y_train_pred = pipe.predict(X_train)
    y_test_pred = pipe.predict(X_test)

    # Accuracy scores
    train_acc = accuracy_score(y_train, y_train_pred)
    test_acc = accuracy_score(y_test, y_test_pred)

    base_results[name] = {
        "train_accuracy": train_acc,
        "test_accuracy": test_acc
    }

    # Output
    print(f"\n {name.upper()}")
    print(f"Train Accuracy: {train_acc:.4f}")
    print(f"Test Accuracy:  {test_acc:.4f}")
```

```
 DT
Train Accuracy: 0.9448
Test Accuracy:  0.5830

 RF
Train Accuracy: 0.9473
Test Accuracy:  0.6397
```

Base model results interpretation

The base model results indicate underfitting with high train accuracy and much lower test accuracy for both Decision Trees (dt) and Random Forest Classifiers (rf).

- DT: Train Accuracy: 0.9448 Test Accuracy: 0.5830
- RF: Train Accuracy: 0.9473 Test Accuracy: 0.6397

In [50]:
```
# Creating base DT and base RF training and testing accuracy variables for plotting

DT_train_accuracy = base_results["dt"]["train_accuracy"]
DT_test_accuracy  = base_results["dt"]["test_accuracy"]

RF_train_accuracy = base_results["rf"]["train_accuracy"]
RF_test_accuracy  = base_results["rf"]["test_accuracy"]
```

In [51]:
```
# In an attempt to improve the test accuracy of the Decision Trees and Random Forest
# Saving hyper parameters as param_grids
# Note that, to address class imbalance we added 'model_class_weight' into our hyper
param_grids = {
    "dt": {
        "model__max_depth": [None, 5, 10, 20],

DT Test Accuracy: 0.6457

Tuning RF...

Fitting 5 folds for each of 20 candidates, totalling 100 fits

RF BEST PARAMS:
{'model__n_estimators': 200, 'model__min_samples_split': 2, 'model__min_samples_lea
f': 2, 'model__max_features': None, 'model__max_depth': 30, 'model__class_weight': No
ne}
RF Training Accuracy: 0.7760
RF Test Accuracy: 0.6538
```

In [53]:

```
# Creating tuned DT and tuned RF training and testing variables for plotting

DT_tuned_train_accuracy = tuned_results["dt"]["train_accuracy"]
DT_tuned_test_accuracy  = tuned_results["dt"]["test_accuracy"]

RF_tuned_train_accuracy = tuned_results["rf"]["train_accuracy"]
RF_tuned_test_accuracy  = tuned_results["rf"]["test_accuracy"]
```

Following the hyper parameter tuning, accuracy of the training and test set is closer to each other but still low to be definitive. We shall therefore try neural networks.

Benefits of a Neural Network

Neural networks are a type of machine learning model made of interconnected layers of nodes that learn patterns from data to make decisions.

When compared to the Random Forest Classifier, they:

- Are better for complex patterns.
- Scale better with large data.
- Provide more tools for overfitting such as regularization, dropout and early stopping.
- Handles underfitting with more flexibility by adding more layers (depth) and neurons (width).

For our Neural Network a standard full connected dense neural network was used. This is because the data is tabular, not spatial, and Dense layers are specifically designed to learn

patterns in that kind of structured data. This is the architectural design:

1. What is the task? It's a multiclass because we are predicting 11 possible categorical outcomes.
2. What is the output activation? Softmax
3. What is the loss function? Categorical crossentropy

In [54]:

```
# Setting up a random seed.

np.random.seed(42)

# Convert one-hot labels to integers
y_integers = np.argmax(y_train.values, axis=1)
# ---- Compute class weights (balanced) ----
classes = np.unique(y_integers)
class_weights = compute_class_weight(
    class_weight="balanced",
    classes=classes,
    y=y_integers
)

class_weights = dict(zip(classes, class_weights))
model= keras.Sequential([
    # Inputs

Out[54]:

```
<tensorflow.python.keras.callbacks.History at 0x1a7095e8460>
```

The Neural Networks model has very low accuracy. The best balanced epoch is 64/100: Accuracy 21%, Validation Accuracy 14% which ic very low.

For this project, the dense neural network is not reliable model to use with this dataset because our dataset is structured or tabular which is best for Decision Trees and Random Forest Classifier.

- They handle nonlinear splits directly
- No need for scaling
- Work well with mixed feature distributions
- Require less data to generalize

In [55]:

```
# Creating Neural Network Training and Testing variables for plotting

# Evaluate Neural Network
nn_train_loss, nn_train_accuracy = model.evaluate(X_train, y_train, verbose=0)
nn_test_loss, nn_test_accuracy   = model.evaluate(X_test, y_test, verbose=0)

# Rename variables
NN_train_accuracy = nn_train_accuracy
NN_test_accuracy  = nn_test_accuracy
```

In [56]:

```
# Illustrating the results of different algorithms, base and tuned using a bar chart

# Model names
models = [
    "DT Base",
    "DT Tuned",
    "RF Base",
    "RF Tuned",
    "Neural Net"
]

# Train accuracies
train_acc = [
    DT_train_accuracy,
    DT_tuned_train_accuracy,
    RF_train_accuracy,
    RF_tuned_train_accuracy,
    NN_train_accuracy
]
```

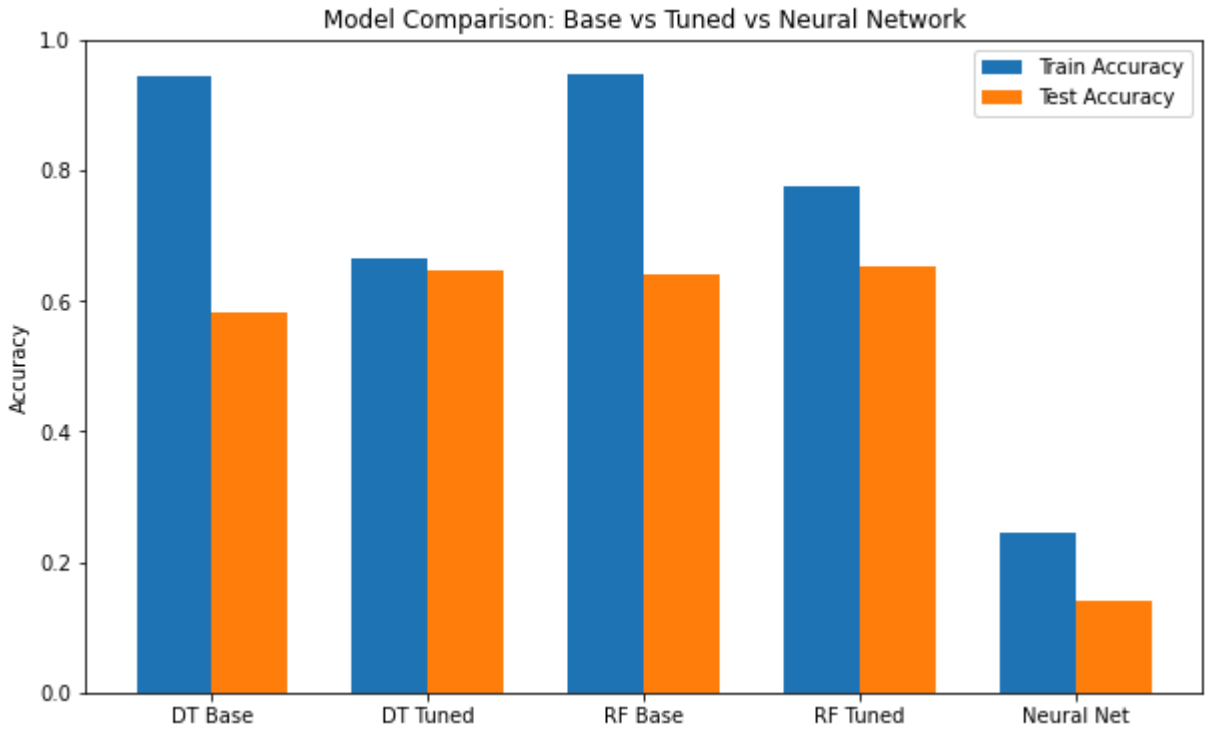
```
# Test accuracies
test_acc = [
    DT_test_accuracy,
    DT_tuned_test_accuracy,
    RF_test_accuracy,
    RF_tuned_test_accuracy,
    NN_test_accuracy
]

# Plot setup
x = np.arange(len(models))
width = 0.35

plt.figure(figsize=(10,6))

plt.bar(x - width/2, train_acc, width, label="Train Accuracy")
plt.bar(x + width/2, test_acc, width, label="Test Accuracy")

plt.xticks(x, models)
plt.ylabel("Accuracy")
plt.title("Model Comparison: Base vs Tuned vs Neural Network")
plt.ylim(0, 1)
plt.legend()
plt.show()
```



From the above illustration, the models that performed best were the Decision Tree as well as the Random Forest Classifier with base hyperparameters.

These outperformed both the neural network as well as the tuned versions since the base models are often near optimal and adding hyperparameters adds unnecessary constraints and reduces generalization slightly.

Despite this, even our best models did not perform as well and had training and testing accuracies below 90% which was our target.

6.2 Model on soil Image Classifier as predictor for crop type

- For this model we will be using the soil_photos_array and crop_type of purely Kenyan data.
- We will be using the neural networks to create our model.

In [60]:
```
# Spliting into training and testing data sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_stat
```

For this neural network, a CNN (Convolutional Neural Network) was used. A Convolutional Neural Network (CNN) is used for images because it is specifically designed to understand spatial structure in visual data, which traditional models (like Decision Trees, Random Forests, or even standard dense neural networks) cannot do well. This is the architectural design:

1. What is the task? It's a multiclass because we are predicting 11 possible categorical outcomes.
2. What is the output activation? Softmax
3. What is the loss function? Categorical crossentropy

In [61]:
```
# Convert one-hot labels to integers
y_integers = np.argmax(y_train.values, axis=1)

# Compute class weights (balanced)
classes = np.unique(y_integers)

class_weights = compute_class_weight(
    class_weight="balanced",
    classes=classes,
    y=y_integers
)

class_weights = dict(zip(classes, class_weights))

```

Out[61]:

```
<tensorflow.python.keras.callbacks.History at 0x1a756c504c0>
```

From the above output having tried 15 epochs we got the best testing accuracy of 91% and validation accuracy of 81%.

- We would like to compare this to a neural network that has been trained with more features (soil images + physical soil attributes) to determine performance.

7.0 Recommendations

Almost all crops in this dataset require the exact same physical soil attributes: Cultivated land with no erosion, no surface salt, no surface crust, and no bare soil.

- Cereals, Vegetables, and Other Crops (Rubber) are "Flatland" crops. They prefer strictly flat, level land with fine gravel and very few coarse fragments.
- Fodder Plants also prefer flat land, fine gravel but uniquely stand out for having the highest association with aquatic or regularly flooded areas.
- Fruits, Fibre Crops, Oilcrops, and Pulses are "Gentle Slopes" crops. They prefer very gently sloping level land and thrive in a mix of fine to medium gravel. Fruits and fibre crops are heavily associated with tree cover.
- Roots and Tubers are "Irregular" crops. They have a higher tolerance for sloping land and are uniquely characterized by being planted in highly irregular field patterns.
- Semi-Luxury Foods, Coffee, Tea, Cocoa, Nuts are "Shrub/Tree" crops. They prefer slightly steeper sloping land, lean toward medium gravel, and are grown in smaller (1 to 2 acre) plots dominated by trees and shrubs.
- Nursery Stock are the Outlier crops. They thrive on sloping land with coarse gravel, utilizes tiny, scattered plots (less than 1 acre), and frequently tolerate bare soil.

Despite these suggestions, recall that crop growth is dependent on more than 1 physical attribute. We therefore advise for the use of the aforementioned developed models to predict crop type.

Concerning fertilizer options, given what farmers are using, consider the following recommendations based on observed usage.

- **Cereals:** Use **crop residue or inorganic fertilizer**, as both are commonly applied with crop residue slightly leading.
- **Fibre crops:** Use **inorganic fertilizer**, which is the most widely used option for these crops.
- **Fodder plants:** Use **crop residue or inorganic fertilizer**, as they are equally the most common choices.
- **Fruits:** Use **crop residue**, with moderate support from animal manure as a secondary option.
- **Nursery stock:** No clear fertilizer recommendation, as none are currently used in the data.
- **Oilcrops:** Use **crop residue**, which is the most preferred fertilizer by a clear margin.
- **Other crops (e.g., rubber):** Use **inorganic fertilizer**, though overall fertilizer use is generally low.
- **Pulses:** Use **crop residue**, with inorganic fertilizer as a secondary option.
- **Roots and tubers:** Use **crop residue**, which is the most commonly applied input.

- **Semi-luxury crops (coffee, tea, cocoa, etc.):** Use **inorganic fertilizer**, the most dominant choice.
- **Vegetables:** Use a **combination of crop residue, animal manure, and inorganic fertilizer**, as all are equally important.

8.0 Limitations

These are the limitations we encountered:

1. Limited labeled image dataset during modelling of our images to determine crop type. We had only 87 usable Kenyan soil images after cleaning which was a low sample. Fortunately, this small dataset did not reduce the generalisation ability of CNN model which performed well.
2. There was also class imbalance in crop types with some crops appearing very frequently while others appearing not as frequently. To tackle this, we applied class weights in our hyperparameter tuning. The aforementioned, however, did not aid in improving our dense neural network model.
3. In our dataset, vertical images contained noise with irrelevant objects. Some of these included tools, holes, hands. This limited their use in the image classification and thus we only focused on 'Horizontal up' photos.
4. The suggestions on fertilizer options to consider was based on observed usage from the dataset. This might not reflect optimal fertilizer options since the dataset did not contain factors such as yield or crop health.

9.0 Future Suggestions

We advise on:

1. Expanding the dataset by collecting a larger and more diverse set of soil images across multiple African countries, different climatic zones, seasons, and farming conditions to improve model generalisation, reduce bias, and enhance real-world performance.
2. Developing multimodal fusion models that combine soil images, physical soil attributes, and weather and climate data, crop yield and health to improve prediction accuracy and produce more robust and context-aware recommendations.

10.0 Model Export for Deployment

In [62]:
```
# Create models directory if it doesn't exist
os.makedirs('models', exist_ok=True)
print("✓ Created 'models' directory")
```

```
✓ Created 'models' directory
```

In [63]:
```
# Save Random Forest model (best for physical attributes)
rf_model = best_models["rf"]
joblib.dump(rf_model, 'models/random_forest_physical.pkl')
print("✓ Saved Random Forest model → models/random_forest_physical.pkl")
```

```
✓ Saved Random Forest model → models/random_forest_physical.pkl
```

In [64]:
```
# Save CNN model (best for soil images)
model.save('models/cnn_image_classifier.h5')
print("✓ Saved CNN model → models/cnn_image_classifier.h5")
```

```
✓ Saved CNN model → models/cnn_image_classifier.h5
```

In [65]:
```
# Save physical features list (for API to know expected input format)
# Extract feature names from the Random Forest model or phyc_soil_df
try:
    # Try to get from model if available
    if hasattr(rf_model.named_steps['model'], 'feature_names_in_'):
        physical_features = rf_model.named_steps['model'].feature_names_in_.tolist()
    else:
        # Get from one-hot encoded features - we'll extract from phyc_soil_df
        X_encoded = pd.get_dummies(phyc_soil_df, drop_first=True)
        physical_features = X_encoded.columns.tolist()
except:
    # Fallback: manually list common features from the physical soil data
    physical_features = list(phyc_soil_df.columns)

joblib.dump(physical_features, 'models/physical_features.pkl')
print(f"✓ Saved {len(physical_features)} physical features → models/physical_feature
```

```
✓ Saved 36 physical features → models/physical_features.pkl
```

In [66]:
```
# Save crop types (for API to map predictions to crop names)
# Get unique crop types from merged Kenyan dataset
crop_types = sorted(merged_physical_and_images_df["crop_type"].unique().tolist())
joblib.dump(crop_types, 'models/crop_types.pkl')
print(f"✓ Saved {len(crop_types)} crop types → models/crop_types.pkl")
print(f"  Crops: {crop_types}")
```

```
✓ Saved 8 crop types → models/crop_types.pkl
  Crops: ['Cereals', 'Fodder plants', 'Fruits', 'Other crops (e.g., rubber)', 'Pulse
s', 'Roots and tubers', 'Semi-luxury foods (coffee, tea, cocoa, tobacco, nuts)', 'Veg
etables']
```

In [67]:
```
# Verify all files were created
model_files = os.listdir('models')
print("ALL MODELS EXPORTED SUCCESSFULLY")
for file in sorted(model_files):
    file_size = os.path.getsize(f'models/{file}') / 1024 / 1024  # Convert to MB
    print(f"  {file} ({file_size:.2f} MB)")
```

```
ALL MODELS EXPORTED SUCCESSFULLY
  cnn_image_classifier.h5 (273.65 MB)
  crop_types.pkl (0.00 MB)
  dnn_physical.h5 (273.65 MB)
  physical_features.pkl (0.00 MB)
  random_forest_physical.pkl (30.26 MB)
```
